Anthony Narine

Full-Stack Software Engineer | Brooklyn, NY | fanarine@pm.me | github.com/anthonynarine | linkedin.com/in/anthony-narine-9ab567245 | anthonynarine.com

Full-stack software engineer designing and building production-oriented SaaS, real-time, security automation, healthcare, and AI-assisted systems with React, TypeScript, Python, Django, FastAPI, PostgreSQL, and Redis. Experienced in application architecture, multi-tenant authorization, REST APIs, authentication systems, transaction-safe financial workflows, WebSockets, and AI features grounded in verified application data. Built Foundry, a language- and framework-agnostic engineering control plane that enables building across technology stacks with governed AI agents. Brings 17 years of vascular ultrasound experience to healthcare software and clinical workflow design.

TECHNICAL SKILLS

Engineering Tooling: Language-Agnostic Agent Orchestration, Git Worktrees, Evidence-Gated Releases, Human Approval Gates

Languages: Python, TypeScript, JavaScript, SQL, HTML, CSS

Frontend: React, Next.js, Vite, TanStack Query, Axios, Tailwind CSS

Backend: Django, Django REST Framework, FastAPI, REST APIs, Django Channels, WebSockets, Celery

Data / Infrastructure: PostgreSQL, Convex, Redis, AWS S3, AWS SES, Docker, Heroku, Netlify, Stripe

Security: JWT, Clerk, access/refresh token flows, RBAC, 2FA, multi-tenant authorization, security automation, audit events

AI: OpenAI APIs, RAG, LangChain, LangGraph, deterministic / grounded assistant workflows

SELECTED SYSTEMS

EstateIQ — AI-Native Financial Operating System (Production)

React, TypeScript, Django, DRF, PostgreSQL, TanStack Query, Stripe, AWS S3/SES, OpenAI | estateiq.me

- Designed and built a multi-tenant SaaS platform for small real estate portfolio owners, combining property, lease, tenant, expense, document, revenue, tax-readiness, and subscription workflows.
- Architected ledger-first financial workflows where charges, payments, and allocations remain source records and balances are derived rather than stored as mutable truth.
- Implemented organization-scoped authorization, Stripe subscription billing, plan enforcement, private document storage, and webhook-driven subscription state.
- Built an AI Copilot layer that analyzes deterministic portfolio and financial data so LLM output explains verified system records rather than inventing financial answers.

Foundry — Language-Agnostic Engineering Control Plane (In Development)

AI Agent Orchestration, Git, Developer Tooling, Release Governance

- Built my own language- and framework-agnostic engineering tool so I can build across technology stacks, coordinating AI agents on Python/Django, React, and TypeScript projects through the same roles and release gates.
- Designed provider-neutral orchestration with scoped agent roles and isolated Git worktrees; releases require recorded evidence, independent review, and signed human approval.
- Stored tasks, decisions, handoffs, and audit records in Git so replacement agents can resume interrupted work from durable repository state.

OneVOne — Real-Time Social Gaming & Poker Platform (Production)

React, Django, DRF, Django Channels, Redis, WebSockets, JWT | onevone.net | github.com/anthonynarine/tic_tac_toe

- Built a server-driven real-time platform supporting multiplayer games, poker tables and tournaments, chat, friends, presence, invitations, direct messaging, and notifications.
- Implemented tournament registration, scheduled starts, roster management, automatic table creation, and tournament-to-game handoff workflows.
- Built multiplayer Texas Hold'em with configurable blinds, starting chip stacks, turn timers, and tables supporting up to nine players.
- Coordinated REST and WebSocket state so clients remain synchronized across gameplay, presence, social interactions, and reconnects.

Gait — Internal Security System (Production)

Django, DRF, JWT, 2FA, RBAC, OpenAI, Security Automation | gaitobservatory.com | github.com/anthonynarine/django_auth

- Built an internal security system for my own applications, combining hardened authentication, evidence-backed findings, constrained AI agents, independent validation, and human approval; Gait protects itself in production, and Lumen signs in through gait-sdk in development.
- Designed deterministic backend boundaries so LLM-assisted agents can investigate failures, reproduce approved weaknesses, and prepare candidate repairs without direct production authority.
- Implemented JWT access/refresh lifecycles, optional 2FA, guest sign-in, protected endpoints, role-based authorization, audit events, and reusable integration patterns for downstream systems.
- Published gait-sdk, an open-source (MIT) Python package on PyPI that lets Django and FastAPI services verify Gait identities through local JWKS validation or token introspection, with live session checks.

Lumen — Vascular Ultrasound Reporting Platform (In Development)

React, TypeScript, Django, DRF, FastAPI, PostgreSQL, Redis, RAG | lumenfoundry.net

- Designing and building a modular vascular ultrasound reporting platform based on real clinical workflows and structured examination protocols.
- Building template-driven exam workflows, structured measurements, clinical calculations, and report-generation infrastructure.
- Architecting centralized authentication, shared observability, media storage, AI-assisted reference workflows, and HL7-oriented integration across services.
- Applying 17 years of vascular ultrasound experience to model clinical workflows, terminology, reporting requirements, and user needs.

PROFESSIONAL EXPERIENCE

Mount Sinai Hospital — Vascular Technologist

September 2013 – Present

- Perform advanced noninvasive vascular ultrasound examinations in complex clinical environments, including evaluation of conditions such as fibromuscular dysplasia and thoracic outlet syndrome.
- Train junior vascular technologists and support consistent examination technique, documentation, and protocol standardization.
- Work within accuracy-sensitive clinical workflows where reliable data collection, communication, and standardized reporting directly affect patient care.

Navix Diagnostix — Vascular Technologist

January 2008 – August 2013

EDUCATION

devCodeCamp

Full Stack Web Development Certificate | March 2023

Long Island University

Sonography in Vascular Technology | September 2007
